Dig hole twice as wide as root ball, at same depth.

Carefully remove pot and loosen or cut plant roots.

Place shrub in hole, slightly above existing grade.

Fill hole with 50% existing soil and 50% Frey’s Professional Planting Mix.

Make a basin to retain water. Fill 3 to 4 times with a mix of water and Natural Alternatives Protilizer. A shrub with a dry root ball can’t absorb water, so make sure the shrub is not dry before planting.

Add a layer of mulch 2 to 3 inches thick, keeping it away from shrub stem.

Water thoroughly every 3 to 4 days during extreme heat or drought.
